

Inconvenientes encontrados:

- El único inconveniente que me encontré fue al intentar ejecutar la aplicación de forma release en vez de hacerlo en modo debug, al hacer esto me aparecía este error:

The screenshot shows an IDE with a Dart file named `main.dart` and a terminal window displaying error messages. The Dart code defines a simple Flutter application with a `MyApp` class and a `MyHomePage` class. The terminal shows four error messages, all indicating that the Dart library `'dart:ui'` is not available on the platform. The errors are located in the `import 'dart:ui' show lerpDouble;` statements within the Flutter framework files. The terminal also shows the command `lib > main.dart > flutter/material.dart > build` and the final status `[Done] exited with code=254 in 28.036 seconds`.

```
lib > main.dart > flutter/material.dart > build
1 import 'package:flutter/material.dart';
2
3 Run|Debug|Profile
4 void main() {
5   runApp(const MyApp());
6 }
7
8 class MyApp extends StatelessWidget {
9   const MyApp({super.key});
10
11   // This widget is the root of your application.
12   @override
13   Widget build(BuildContext context) {
14     return MaterialApp(
15       title: 'Hello World',
16       theme: ThemeData(
17         colorScheme: ColorScheme.fromSeed(seedColor: Colors.deepPurple),
18         useMaterial3: true,
19       ), // ThemeData
20       home: const MyHomePage(title: 'Hello World'),
21     ); // MaterialApp
22   }
23 }
24
25 class MyHomePage extends StatefulWidget {
26   const MyHomePage({super.key, required this.title});
27
28   final String title;
29
30   @override
31   State<MyHomePage> createState() => MyHomePageState();
32 }
```

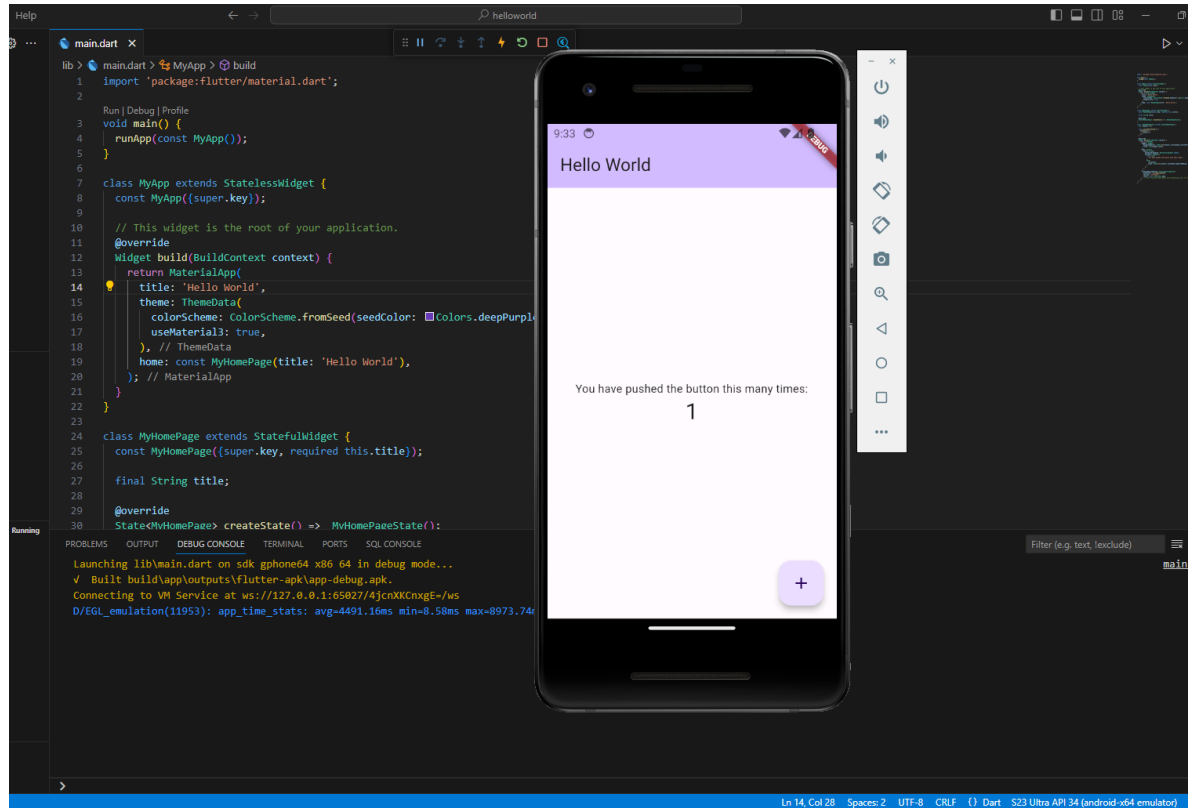

```

Mirando el tutorial en

<https://codelabs.developers.google.com/codelabs/flutter-codelab-first?hl=es-419#3>

me di cuenta de que había que hacerlo en modo debug

Imagen de App en ejecución:
